# Redirect Output from the Windows Command Line to a Text File

Avoid scrolling and/or save the generated output

Written by: [Aseem Kishore](#)

Posted on: May 18th, 2010 in: [How-To](#)

When you type a command on the Windows command line, the output from the command is displayed in the command prompt window. For some commands, the output can be several rows long and sometimes longer than the height of the command window, causing you to scroll to view all of the output.

If you want to avoid this, or if you want to save a copy of the output generated by a command, you can copy the text from the command window and paste it into a text file. However, there is an easier method of “copying” output to a text file. You use the **redirection** command.

## Redirect Command Line Output

To use the redirection command, use the “>” symbol and a filename at the end of the command you want to execute.

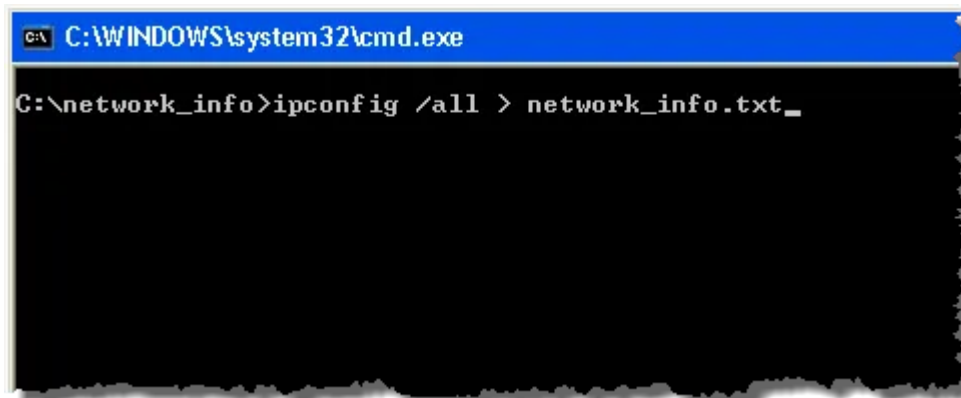

For example, if you want to save the output from the **ipconfig** command (displays networking settings), open the command window and type the following command.

```
ipconfig /all > network_info.txt
```

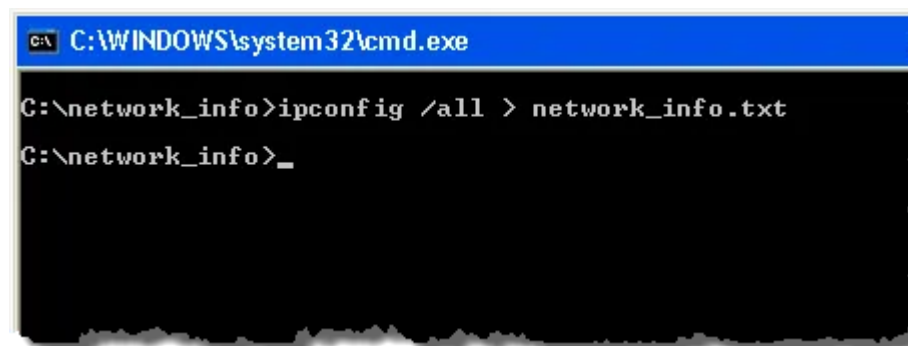

**NOTE:** This creates the file, **network\_info.txt**, in the current directory. In this example, shown in the following image, the file will be saved to the **C:\network\_info** directory. If you want to save the file to a different directory you can specify the full path of the directory in the command window as follows:

```
ipconfig /all > c:\my_directory\network_info.txt
```

```
C:\> C:\WINDOWS\system32\cmd.exe  
C:\network_info>ipconfig /all > network_info.txt_
```

Once you enter the command and press Enter, you are returned to the command prompt. The output is sent to the text file, but not to the screen, so you do not see the output.

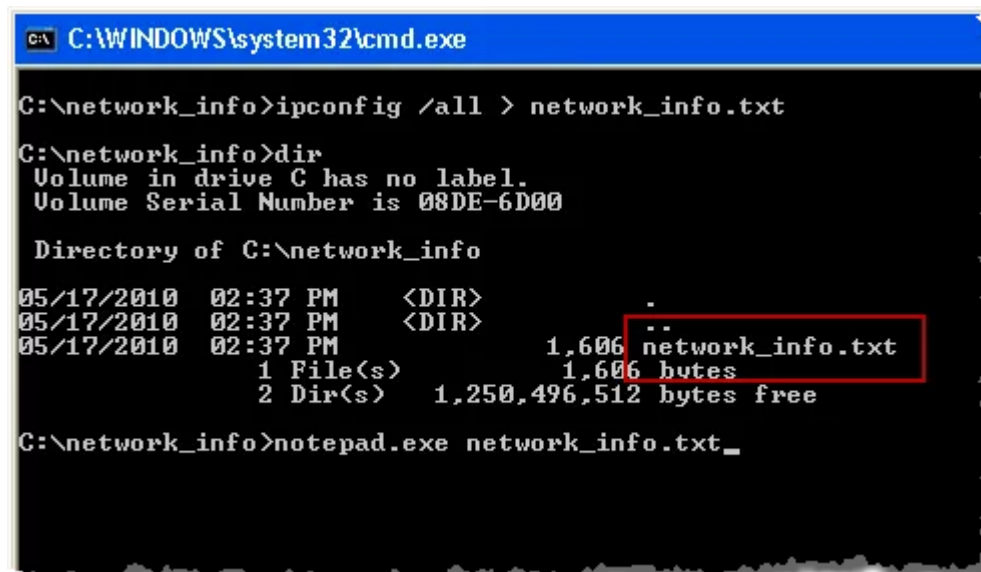

```
C:\> C:\WINDOWS\system32\cmd.exe  
C:\network_info>ipconfig /all > network_info.txt  
C:\network_info>_
```

The **network\_info.txt** file is created in the current directory. To view the output, type the following command to open the text file in **Notepad**:

```
notepad.exe network_info.txt
```

**NOTE:** If you saved the file to a different directory, be sure to put the full path to the file after “**notepad.exe**” on the command line as follows:

```
notepad.exe C:\my_directory\network_info.txt
```

```
C:\WINDOWS\system32\cmd.exe

C:\network_info>ipconfig /all > network_info.txt

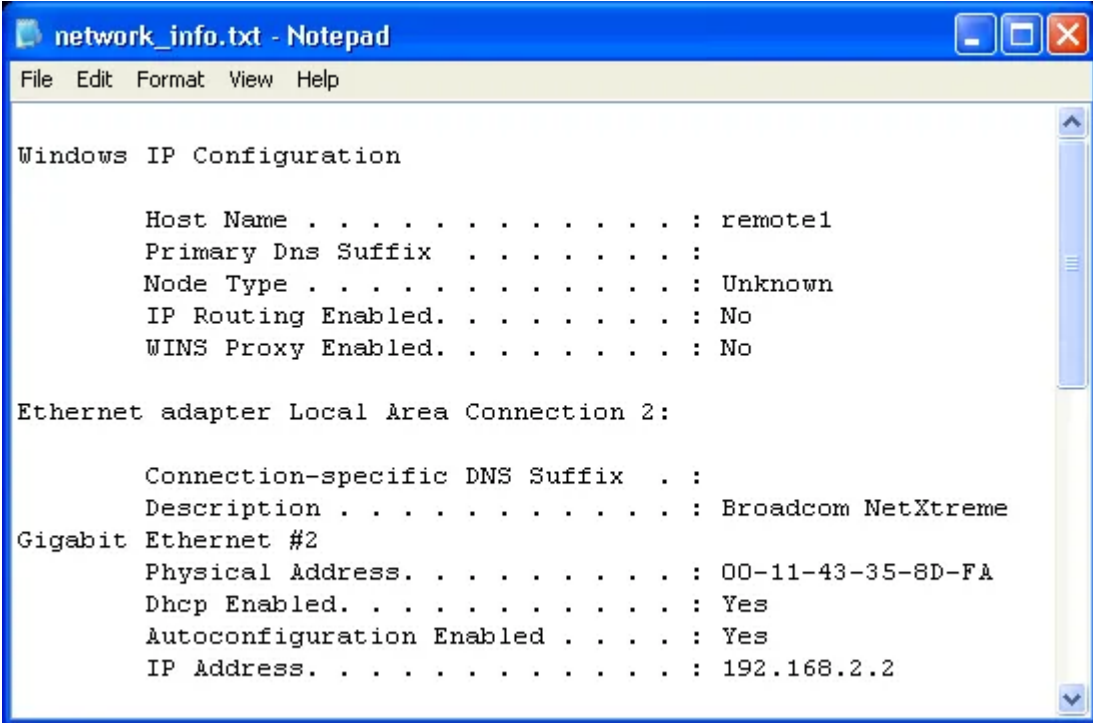

C:\network_info>dir
Volume in drive C has no label.
Volume Serial Number is 08DE-6D00

Directory of C:\network_info

05/17/2010  02:37 PM    <DIR>          .
05/17/2010  02:37 PM    <DIR>          ..
05/17/2010  02:37 PM                1,606 network_info.txt
               1 File(s)                1,606 bytes
               2 Dir(s)  1,250,496,512 bytes free

C:\network_info>notepad.exe network_info.txt_
```

Note that you can also just browse to that directory in Explorer and open the file from there. Here is an example of the output if the **ipconfig** command in a text file.

A screenshot of a Notepad window titled "network\_info.txt - Notepad". The window contains text output from a Windows command line, showing IP configuration details. The text is as follows:

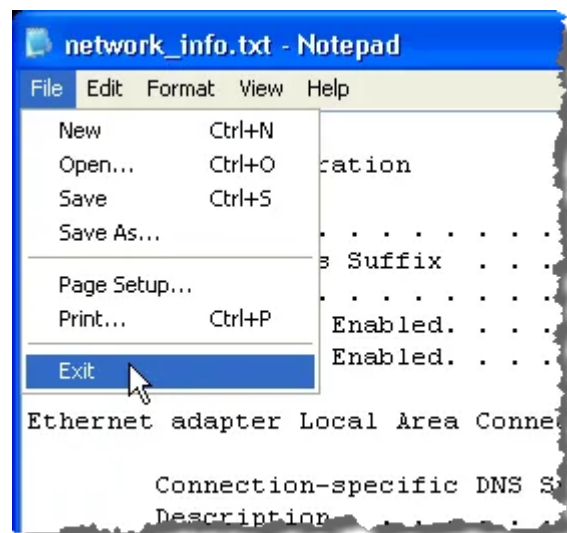

```
Windows IP Configuration

    Host Name . . . . . : remotel
    Primary Dns Suffix . . . . . :
    Node Type . . . . . : Unknown
    IP Routing Enabled. . . . . : No
    WINS Proxy Enabled. . . . . : No

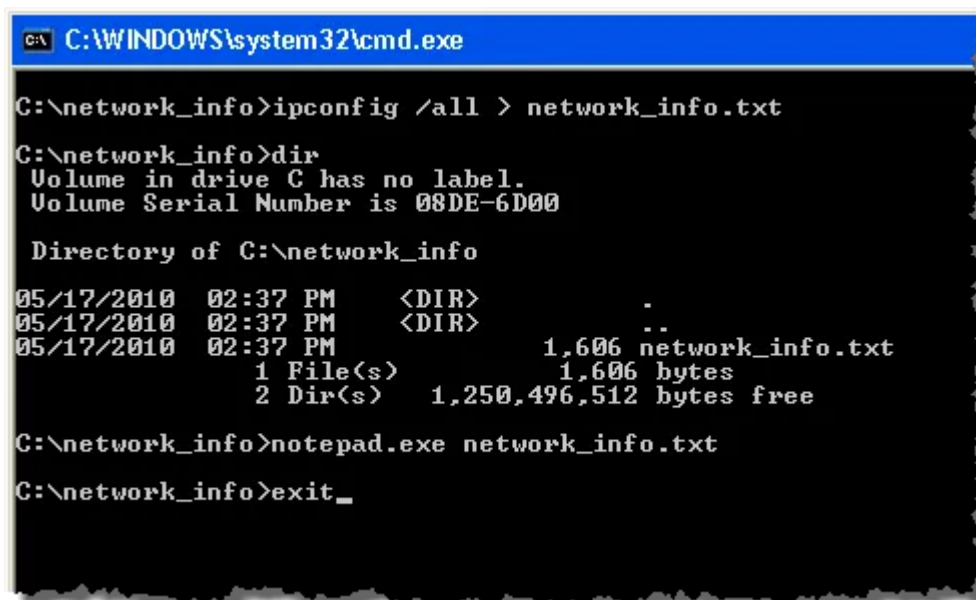

Ethernet adapter Local Area Connection 2:

    Connection-specific DNS Suffix  . :
    Description . . . . . : Broadcom NetXtreme
    Gigabit Ethernet #2
    Physical Address. . . . . : 00-11-43-35-8D-FA
    Dhcp Enabled. . . . . : Yes
    Autoconfiguration Enabled . . . . : Yes
    IP Address. . . . . : 192.168.2.2
```

To close **Notepad**, select **Exit** from the **File** menu.

To close the command window, type **exit** at the command prompt and press **Enter**.

```
C:\WINDOWS\system32\cmd.exe

C:\network_info>ipconfig /all > network_info.txt

C:\network_info>dir
Volume in drive C has no label.
Volume Serial Number is 08DE-6D00

Directory of C:\network_info

05/17/2010  02:37 PM    <DIR>          .
05/17/2010  02:37 PM    <DIR>          ..
05/17/2010  02:37 PM                1,606 network_info.txt
               1 File(s)                1,606 bytes
               2 Dir(s)  1,250,496,512 bytes free

C:\network_info>notepad.exe network_info.txt

C:\network_info>exit_
```

**NOTE:** If you use the same filename a second time, that file will be overwritten and any output it previously contained will be lost. To preserve your previous output, use a different filename or you can append the output to the end of an existing file. To append data to an existing file, use two redirection symbols as shown below:

```
dir c:\my_music >> network_info.txt
```

**NOTE:** Redirection is also useful for saving directory listings. The previous command saves a listing of the **c:\my\_music** directory into the end of the **network\_info.txt** file. Enjoy!
