Use The Command Prompt To Open And Display Folder Contents In Windows Explorer

One great feature of Windows is the capability to open any folder location in a Command prompt, from Windows Explorer, by right clicking on a folder and selecting "Command Prompt Here".

But if you use Windows command prompt often, there may be times when you want the reverse to happen...meaning you want to open a folder

location **from** the command prompt, and have the folder and it's contents displayed in Windows Explorer.

To do this, open a command prompt from the keyboard by typing *Win+R*, or click on *Start \ Run* then type *cmd* in the run box and click OK.

Navigate to the folder you want displayed in Windows Explorer by using the Change Directory command "**cd**" (with out the quotes).

In the below screen shot I have **cd** to the *Windows* folder.

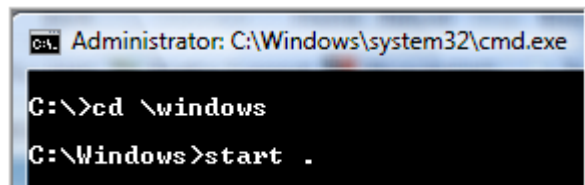

```
Administrator: C:\Windows\system32\cmd.exe
C:\>cd \windows
C:\Windows>
```

Now type the following command...

start .

Note: *above command is typed as start, followed by a space, followed by a period.*

```
Administrator: C:\Windows\system32\cmd.exe
C:\>cd \windows
C:\Windows>start .
```

...and Windows Explorer will open to the folder location that you were in at the command prompt, and display it's contents.

Check It Out!

If you want Windows Explorer to open the parent folder of the current location, just type

start ..

In the below screenshot, the root of C:\ is the parent folder of Windows.

This trick is pretty cool and very useful for any command line geek.

Also, at the beginning of this article, I mentioned the capability to open a folder location in a Command prompt, by right clicking on a folder and selecting "Command Prompt Here".

In Vista, it is included by default, but in XP it is not. If you are missing this option in XP, you can add it to the context menu by following these steps:

- Click on *Start \Run* then type *regedit* and click *OK*
- In the left menu tree, go to *HKEY_CLASSES_ROOT\Directory\shell*
- Right click on *shell* and select *New \ Key*
- Name the key *Open Command Prompt Here*
- Right click on the newly created key (*Open Command Prompt Here*) and select *New \ Key*
- Name the new key *command*
- Select the newly created *command* key and double-click on *default value*
- Enter *cmd.exe /k cd %1* and click on *Ok*

That's all there is to it!

Windows directory is opened by using C:\Windows\Start.

How to close the opened window using command prompt.

[Watching The Net](#) @ 6:48 am

[Reply](#)

@Kalpana

Typing "exit" (without the quotes) will close the prompt.

Every time I try to open a folder via command prompt, I get a message that says it can not access it. However, my computer is currently under a horrible virus that seems impossible to remove, but I feel that being able to open a folder somehow will help.

Hi and thank you very much this is great!

Just wanted to note, you can actually skip the 'cd' step altogether and type:

start \windows

this should do the same in one line instead of two!

thanks again great help for opening USB directory (since they tend to change drive letters)

OK, so I added the command prompt feature by going to folder options / file types / (NONE) File Folder / Advanced and added a Command Prompt CMD feature, then every time I clicked on a folder I got a command prompt, in my attempts to undo it I think I may have deleted the feature to simply double click on a folder to open it, now when i double click a folder it brings up windows search. I am running windows XP, please advise.

Excellent tip. I had been looking and looking for some time on how to open the "My Documents" directory specifically.

In a command prompt, I would get to the parent directory (c:\users\paul), and then type "start "My Documents". All that would happen was that another command window would pop up. The actual directory wouldn't open.

I tried all sorts of things, Googling all sorts of various searches like "can't open My Documents folder from command line", etc.

After trying "start /?", and THAT not helping, and trying all sorts of commands, finally, I thought of trying "start explorer.exe \users\paul\My Documents" - AND THAT WORKED!

Wish I had found your site long before I came upon it myself with what seems to be simply another way to open up the "My Documents" directory!

Anyway, I like your version of the trick too.

The whole reason in the first place for me wanting to do this, was to be able to make a SHORTCUT of it so I could use my keyboard to open up my "My Documents" directory using a keyboard shortcut ("Ctrl-Alt-Shift-m"). I FINALLY can quickly open it up now as I've always wanted to.

Yay - and thanks.

moltres rider @ 4:48 pm

[Reply](#)

this DOES NOT work!!!! all it does is open another command prompt with that directory!!!!!!

March 24, 2012

Mike Boyds @ 7:25 am

[Reply](#)

@moltres rider

No sure why it's not working for YOU. Make sure the command you are typing has no syntax errors.

April 28, 2012

moltres rider @ 8:45 pm

[Reply](#)

@Mike Boyds:

there is no syntax errors!! it just brings up another command prompt window!!!

April 29, 2012

Mike Boyds @ 8:06 am

[Reply](#)

@moltres rider

It would be best if you post **exactly** what you are entering at the command prompt so we can see what's going on....

August 1, 2012

Stuart U @ 9:07 pm

[Reply](#)

I have the same issue as Mike, however I believe there is a bug in the command.

For example, if I have a folder called Project 99, start "Project 99" will open a new command shell.

If I change the folder name to Project99, no problem.

January 30, 2014

Smylers @ 10:54 am

[Reply](#)

To open a folder with a space in its name, use the /D switch to specify the starting directory for the command (which quoted spaces work fine in) and then just . for the command itself.

So for Stuart U's "Project 99" folder, do:

start /D "Project 99" .
