In Windows batch files, I accept variable from user input by `set /p var1=` , after `var1` is used, I don't know how to reset/clear its value.

If I don't reset/clear its value, when user meets `set /p var1=` again, and user enter directly. the previous input value will be still there. I don't want it, How to reset it for new user input?

batch-file

To clear a variable, regardless how it was set:

```
set "var1="
```

1　What is the issue / Why the obfuscation? That simply expands to `set "var="` – dbenham Jun 15 '13 at 1:03

@dbenham thank you :) – Endoro Jun 15 '13 at 11:47
